## REVISION NOTES

## AMOUNT OF SUBSTANCE -1

ChemistryOnlineTuition Ltd reserves the right to take legal action against any individual/ company/organization involved in copyright abuse.

## Amount of Substance

## Moles

One mole of a substance contains Avogadro's number of particles, which is approximately 6.022 $\times 10^{23}$ particles. For example, one mole of an apple contains about $6.022 \times 10^{23}$ apples, and one mole of Nitrogen molecules contains about $6.022 \times 10^{23}$ Nitrogen molecules.

This number is known as the Avogadro constant $\left(=6.022 \times 10^{23} \mathrm{~mol}^{-1}\right)$

## Relative atomic mass

Relative atomic mass is the average mass of one atom compared to one-twelfth of the mass of one atom of carbon-12.

## Relative molecular mass

Relative molecular mass is the average mass of a molecule compared to one-twelfth of the mass of one atom of carbon-12

## Relative Isotopic mass

Relative atomic mass is the mass of one atom compared to one-twelfth of the mass of one atom of carbon-12.

## Exam Question

Define the term relative atomic mass.

## Important equations to remember

For gases, liquids, and Solids

- Moles = Given mass / Molar mass

Where,
Mass = grams
Units $=\mathrm{mol}$
The molar mass ( Mr ) of a compound is calculated by adding the mass numbers of its elements from the periodic table.

## Example 1:

$\mathrm{CaCl}_{2}=40.1+(35.5 \times 2)=111.1$

## Example 2:

What is the number of moles in 35.0 mg of
$\mathrm{H}_{2} \mathrm{SO}_{4}$ ?
Moles $=$ mass $/ \mathrm{Mr}$
Convert mg into grams by dividing it by 1000
$=0.035 /(2+32.0+16.0 \times 4)$
$=3.57 \times 10^{-4} \mathrm{~mol}$

One mole of any gas irrespective of its mass at RTP occupies a volume of $24000 \mathrm{~cm}^{3}$ or $24 \mathrm{dm}^{3}$ Therefore,

Moles = given volume / Molar volume.

## Example

Calculate the moles of oxygen having a volume of $6000 \mathrm{~cm}^{3}$.
Moles $=6000 / 24000$
$=0.25$ moles .

For gases,

## Ideal Gas Equation:

- $P V=n R T$

Where,

Unit of Pressure (P): Pa
Unit of Volume (V): m3
Unit of Temp (T): K
$\mathrm{n}=$ moles
$R=8.31$

## Example

Calculate the mass of $\mathrm{N}_{2}$ gas that has a pressure of 100 kPa , temperature 40 Celcius, volume $400 \mathrm{~cm}^{3}$. ( $\mathrm{R}=8.31$ )

Moles $=$ PV/RT
$=100000 \times 0.0004 /(8.31 \times 293)$
$=0.01537 \mathrm{~mol}$
$100 \mathrm{kPa}=100000 \mathrm{~Pa}$

40 Celcius $=40+273=313 \mathrm{~K}$
$400 \mathrm{~cm} 3=0.0004 \mathrm{~m}^{3}$
Mass $=$ moles $\times \mathrm{Mr}$
$=0.01537 \times(28 \times 2)$
$=0.86072 \mathrm{~g}$

## Changing the Conditions of a gas.

Occasionally, there are questions that relate to the quantity of gas in different conditions.

## Example

$80 \mathrm{~cm}^{3}$ of nitrogen and $40 \mathrm{~cm}^{3}$ of carbon monoxide, each at 298 K and 100 kPa , were placed into an evacuated flask of volume $0.70 \mathrm{dm}^{3}$. What is the pressure of the gas mixture in the flask at 298 K ?

There are two ways to solve this problem:

1. Calculate the moles of gas using the ideal gas equation. Then, substitute the new conditions back into the same equation.
2. Alternatively, you can use the equation $n=P V / R T$ by combining all the variables below. This method works because the number of moles of gas remains constant throughout the process.

$$
\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2}
$$

As the Temperature is the same, we can make the above equation $\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2}$
$P_{2}=P_{1} V_{1} / V_{2}$
$=100000 \times 1.2 \times 10^{-4} / 7 \times 10^{-4}$
$=17142 \mathrm{~Pa}$

## For Solutions

- Concentration $=$ Moles $/$ Volume

Unit of concentration: mol dm-3 or M
Unit of Volume: dm3

Conversion of Volumes
cm3 to dm $3 \div 1000$
cm3 to $\mathrm{m} 3 \div 1000000$
dm3 to $\mathrm{m} 3 \div 1000$

## Example

Calculate the solution concentration made by dissolving 7 g of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in $400 \mathrm{~cm}^{3}$ water.
moles $=$ mass $/ \mathrm{Mr}$
$=7 /(39.0 \times 2+12+16 \times 3)$
$=0.05072 \mathrm{~mol}$

Concentration $=$ moles/Volume
$=0.0507 / 0.400$
$=0.126 \mathrm{~mol} \mathrm{dm}{ }^{3}$

## Avogadro's Constant

There are $6.022 \times 10^{23}$ atoms in 12 grams of carbon-12. Therefore, explained in more straightforward terms 'One mole of any specified entity contains $6.022 \times 10^{23}$ of that entity.

Avogadro's Constant can be used for atoms, molecules, and ions.
AVOGADRO'S NUMBER

One mole of Zinc atoms will contain $6.022 \times 10^{23}$ atoms of zinc.
One mole of water molecules will contain $6.022 \times 10^{23}$ molecules of water.
One mole of sodium ions contains $6.022 \times 10^{23}$ ions of sodium.

You might be asked to calculate the number of atoms/particles in a question. Once you have calculated the moles, use the following equation to get the particle number.

## No of particles/atoms/ions = moles of substance (in mol) X Avogadro's constant

## Example:

How many atoms of zinc are there in a 12.00 g sample of Zinc metal?

Moles = mass $/$ Ar
$=12.00 / 65.38$

$$
=0.18354 \mathrm{~mol}
$$

Number atoms $=$ moles $\times$ Avogadro's number
$=0.18354 \times 6.022 \times 10^{23}$
$=1.105277 \times 10^{23}$

- Density = Mass/volume

Density is usually given in $\mathrm{g} \mathrm{cm}-3$

## Example:

How many molecules of ethanol are there in a $0.300 \mathrm{dm}^{3}$ of propanol $\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right)$ liquid?
The density of ethanol is $0.789 \mathrm{~g} \mathrm{~cm}-3$
Number of molecules $=$ moles $\times 6.022 \times 1023$
$=8.576 \times 6.022 \times 1023$
$=5.16 \times 1024$ (to 3 sig fig)
Mass $=$ density x Volume
$=0.789 \times 500$
$=394.5 \mathrm{~g}$
ethanol
moles $=$ mass $/ \mathrm{Mr}$
= 394.5/46.0
$=8.576 \mathrm{~mol}$

## Empirical formula

An empirical formula represents the simplest whole-number ratio of atoms of each element in a compound.

There are three steps to follow to find the empirical formula of a substance.
Step 1: Divide each mass (or \% mass) by the atomic mass of the element.

Step 2: Divide each answer from step 1 by the smallest one of those numbers.
Step 3: Sometimes, the numbers calculated in step 2 will need to be multiplied up to give whole numbers. These whole numbers will be the empirical formula.

You can use this method for the following data types:

1. masses of each element in the compound given
2. percentage mass of each element in the compound

## Example

A compound $P$ contains $73.47 \%$ carbon and $10.20 \%$ hydrogen by mass, the remainder being oxygen. It is found from other sources that P has a Relative Molecular Mass of $98 \mathrm{~g} \mathrm{~mol}-1$.

Calculate the molecular formula of $P$.

C
73.47
10.20
(100-73.47-10.20) $=16.33$

| By r.a.m | $\frac{73.47}{12}$ | $\frac{10.20}{1}$ | $\frac{16.33}{16}$ |
| :--- | :---: | :---: | :---: |
| By smallest | 6.1225 | $=10.20$ | $=1.020$ |
| Ratio of atoms | $\frac{6.1255}{1.020}$ | $\frac{10.20}{1.020}$ | $\frac{1.020}{1.020}$ |

Therefore the empirical formula is $\mathbf{C}_{6} \mathbf{H}_{10} \mathbf{O}$.

## Molecular formula

A molecular formula is the actual number of atoms of each element in the compound.

| Element | Molecular Formula | Empirical Formula |
| :--- | :---: | :---: |
| Water | $\mathrm{H}_{2} \mathrm{O}$ | H 2 O |
| Glucose | $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ | $\mathrm{CH}_{2} \mathrm{O}$ |
| Hydrogen Peroxide | $\mathrm{H}_{2} \mathrm{O}_{2}$ | HO |
| Butane | $\mathrm{C}_{4} \mathrm{H}_{10}$ | $\mathrm{C}_{2} \mathrm{H}_{5}$ |
| Banzene | $\mathrm{C}_{6} \mathrm{H}_{6}$ | CH |

## Example

Work out the molecular formula for the compound with an empirical formula of $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}$ and a Mr of 116

## $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{O}$ has a mass of 58

The empirical formula fits twice into Mr of 116

So molecular formula is $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{2}$

## Limiting Reactant

In a chemical reaction, the reactant that is used up first and restricts the amount of product that can be produced is called the limiting reactant. This reactant is responsible for determining the maximum amount of product that can be produced.

## Example:

Propane reacts with oxygen as shown:
$\mathrm{C}_{3} \mathrm{H}_{8}+5 \mathrm{O}_{2} \rightarrow 3 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O}$

How many moles of products are formed when 1 mole of $\mathrm{C}_{3} \mathrm{H}_{8}$ is mixed with 8 moles of $\mathrm{O}_{2}$ ?

$$
\mathrm{C}_{3} \mathrm{H}_{8}+5 \mathrm{O}_{2} \longrightarrow 3 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O}
$$

| moles at the start | 1 mol | 8 mol |  |  |
| :--- | :--- | :--- | :--- | :--- |
| change in moles | 1 mol react | 5 mol react | 3 mol made | 4 mol made |
| moles at the end | $1-1=0 \mathrm{~mol}$ | $8-5=3 \mathrm{~mol}$ | $0+3=3 \mathrm{~mol}$ | $0+4=4 \mathrm{~mol}$ |

Therefore,
$\mathrm{C}_{3} \mathrm{H}_{8}=$ limiting reagent
$\mathrm{O}_{2}=$ in excess ( excess reagent)

## Percentage yields

You might not get the expected amount of product when you create a new substance through a chemical reaction. For instance, if you react 12 grams of Carbon with 32 grams of oxygen, you may end up with less than 44 grams of water. The reasons for this could be:

- The reaction may be reversible, which means that both the forward and backward reaction can occur.
- Some of the product may be lost during the separation process from the reaction mixture.
- Some of the reactants may react with other substances in other chemical reactions.

$$
\% \text { yield }=\frac{\text { mass of product obtained }}{\text { maximum theoretical mass of product }} x 100
$$

## Example Percent Yield Calculation

First, here is a simple example of the percent yield calculation in action:
The decomposition of magnesium carbonate forms 12 grams of magnesium oxide in an experiment. The theoretical yield is 19 grams.

What is the percent yield of magnesium oxide?
$\mathrm{MgCO} 3 \rightarrow \mathrm{MgO}+\mathrm{CO} 2$

Here, you know the actual yield (15 grams) and the theoretical yield (19 grams), so plug the values into the formula:

Percent Yield $=$ Actual Yield/Theoretical Yield $\times 100 \%$

Percent Yield $=12 \mathrm{~g} / 19 \mathrm{~g} \times 100 \%$
Percent Yield $=63.15$ \%

## Atom Economy

Atom economy is a metric used to evaluate the efficiency of a chemical reaction.
It measures the proportion of the desired product to the amount of waste generated during the reaction. The higher the atom economy value, the greater the percentage of starting materials that are converted into the desired product, resulting in less waste.

A reaction with a high atom economy is preferable in terms of cost and environmental impact, as it reduces the amount of resources needed and the amount of waste generated.

$$
\% \text { atom economy }=\frac{\text { mass of desired product as shown in equation }}{\text { total mass of products as shown in equation }} x 100
$$

## Example

Calculate the percentage atom economy to make sodium from sodium chloride.

$$
2 \mathrm{NaCl} \rightarrow 2 \mathrm{Na}+\mathrm{Cl}_{2}
$$

First, calculate the mass of the desired product,
Atomic mass of Sodium $=23$
So, $23 \times 2=46$ grams.
Second, calculate the total mass of the products,
$=46+(35.5 \times 2)$
$=117$ grams .
Now apply the formula,
$=46 / 117 \times 100$
$=39.3 \%$

## Exam Questions

Calcium sulfide reacts with calcium sulfate as shown.

$$
\mathrm{CaS}+3 \mathrm{CaSO}_{4} \rightarrow 4 \mathrm{CaO}+4 \mathrm{SO}_{2}
$$

2.50 g of calcium sulfide are heated with 9.85 g of calcium sulfate until there is no further reaction.

Show that calcium sulfate is the limiting reagent in this reaction.
Calculate the mass, in g , of sulfur dioxide formed.
$M_{r}(\mathrm{CaS})=72.2$
$M_{r}\left(\mathrm{CaSO}_{4}\right)=136.2$

A compound contains $40.0 \%$ carbon, $6.7 \%$ hydrogen and $53.3 \%$ oxygen by mass.

Which could be the molecular formula of this compound?

A $\mathrm{C}_{2} \mathrm{H}_{2} \mathrm{O}_{2}$ $\square$
B $\mathrm{C}_{2} \mathrm{H}_{2} \mathrm{O}$

C $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}$ $\square$
D $\mathrm{C}_{2} \mathrm{HO}_{2}$ $\square$

What is the percentage atom economy for the production of ethanol from glucose?
$\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \rightarrow 2 \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}+2 \mathrm{CO}_{2}$

A $25.6 \%$

B 27.1\%

C 51.1\%

D 54.2\% $\square$
