Amount of Substance - 2

1.

Given:

- Amount of CaS = 2.50 g
- Amount of CaSO₄ = 9.85 g
- Molar masses:
 - Molar mass of CaS (CaS) = 72.2 g/mol
 - Molar mass of CaSO₄ (CaSO₄) = 136.2 g/mol

Calculate moles of CaS and CaSO₄

Moles of CaS:

$$\text{Moles of CaS} = 2.50 \text{ g} / 72.2 \text{ g/mol} = 0.0346 \text{ mol}$$

Moles of CaSO₄ :

$$\text{Moles of CaSO}_4 = 9.85 \text{ g} / 136.2 \text{ g/mol} = 0.0723 \text{ mol}$$

Determine the limiting reagent

According to the balanced equation:

So 1 mole of CaS requires 3 moles of CaSO₄ .

Moles of CaSO₄ required for CaS:

$$0.0346 \text{ mol CaS} \times 3 = 0.1038 \text{ mol CaSO}_4$$

Since we only have 0.0723 mol of CaSO₄ , it is the limiting reagent.

Calculate moles of SO₂ formed

From the limiting reagent (CaSO₄), calculate moles of SO₂ produced:

$$\begin{aligned} \text{Moles of SO}_2 &= (0.0723 \text{ mol CaSO}_4) \times 4 \text{ mol SO}_2 / 3 \text{ mol CaSO}_4 \\ &= 0.0964 \text{ mol SO}_2 \end{aligned}$$

Calculate mass of SO₂ formed

$$\text{Mass of SO}_2 = 0.0964 \text{ mol} \times 64.1 \text{ g/mol} = 6.18 \text{ g}$$

So, the mass of sulfur dioxide (SO_2) formed in the reaction is 6.18 g.

3. (a)

Given titration results:

Rough: 20.85 cm^3

Titration 1: 20.25 cm^3

Titration 2: 20.50 cm^3

Titration 3: 20.30 cm^3

Mean titre value:

$$\text{Mean titre} = (20.25 + 20.50 + 20.30) / 3$$

$$= 61.05 / 3$$

$$= 20.35 \text{ cm}^3$$

Calculate moles of NaOH:

$$\text{Moles of NaOH} = 0.350 \text{ mol/dm}^3 \times (20.35 \text{ cm}^3 / 1000 \text{ cm}^3/\text{dm}^3)$$

$$\text{Moles of NaOH} = 0.350 \times 0.02035 = 0.0071225 \text{ mol}$$

Moles of ethanoic acid in 25 cm^3 :

$$\text{Moles of CH}_3\text{COOH} = \text{Moles of NaOH} = 0.0071225 \text{ mol}$$

Moles of ethanoic acid in 200 cm^3 :

$$\text{Moles of CH}_3\text{COOH in } 200 \text{ cm}^3 = 0.0071225 \text{ mol} \times 8 = 0.05698 \text{ mol}$$

$$\text{Mass of CH}_3\text{COOH} = 0.05698 \text{ mol} \times 60.05 \text{ g/mol} = 3.420 \text{ g}$$

$$\text{Mass of CH}_3\text{COONa} = 5.60 - 3.419 = 2.181 \text{ g}$$

$$\text{Percentage by mass of CH}_3\text{COONa} = (5.60 / 2.181) \times 100 = 38.95\%$$

(6)

(b)

*Effect of Rinsing Burette with Deionised Water**The titre value would increase. Because the sodium hydroxide solution would be more dilute.*

(2)

4. B

(1)

5. This question is about two experiments on gases.

(a)

Pressure:

$$51.0 \text{ kPa} = 51,000 \text{ Pa}$$

Volume:

$$482 \text{ cm}^3 = 0.000482 \text{ m}^3$$

Calculate moles (n):

$$n = \frac{PV}{RT}$$

$$n = \frac{51,000 \times 0.000482}{8.31 \times 297}$$

$$n = 0.00995 \text{ mol}$$

$$\text{Mass of Y} = 0.717 \text{ g}$$

$$\text{Mr} = \text{mass} / \text{moles} = 0.717 / 0.00995 = 72.06$$

(5)

(b)

Given:

Moles of O_2 used: 0.0075 mol (As half of 0.0200, 0.0200, 0.0200 mol of O_2 was used)

Moles of CO_2 produced: 0.0080 mol

Calculation:

Total moles of gas in the flask:

Total moles = Moles of O_2 + Moles of CO_2

Total moles = 0.0075 mol + 0.0080 mol

= 0.0155 mol

(2)

6. c

(1)

7.

(a)

Given data:

- Pressure of gas (P) = 100 kPa = 100,000 Pa
 - Volume of gas (V) = 178.0 cm³ = 0.178 L = $0.178 \times 10^{-3} \text{ m}^3$
 - Temperature (T) = 120 °C = 120 + 273.15 = 393.15 K
 - Mass of liquid A injected = 0.460 g
- Gas constant (R) = $8.31 \text{ J K}^{-1} \text{ mol}^{-1}$

Volume to cubic meters (m^3):

$$V = 0.178 \text{ L} = 0.178 \times 10^{-3} \text{ m}^3$$

Calculate the number of moles of gas (n) using the ideal gas law:

$$n = \frac{PV}{RT}$$

$$n = \frac{100,000 \times 0.178 \times 10^{-3}}{8.31 \times 393.15}$$

$$= 0.00545 \text{ mol}$$

Molecular mass (M_r) of liquid A:

$M_r = \text{Mass of liquid A} / \text{Number of moles of gas}$

Mass of liquid A = 0.460 g = 0.460×10^{-3} kg

$M_r = 0.460 \times 10^{-3} \text{ kg} / 0.00545 \text{ mol}$

$M_r = 84.40$

(4)

(b)

When some of the liquid injected into the gas syringe does not vaporize completely:

Effect on M_r Calculation:

The calculated M_r will be higher than the actual M_r of the volatile liquid A. This is because the moles of gas used in the calculation (denominator in $M_r = \text{mass} / \text{moles}$) are underestimated. The presence of non-vaporized liquid means the measured mass includes both vaporized and non-vaporized components, but only the vaporized portion contributes to the moles of gas.

Systematic Error:

The presence of non-vaporized liquid introduces a systematic error where the calculated M_r is inflated.

This error arises because the calculation assumes complete vaporization, but in reality, some liquid remains unvaporized, skewing the relationship between measured mass and moles of gas.

Experimental Precision:

To ensure accurate M_r determination, it's crucial that all injected liquid vaporizes completely.

Any residual liquid not vaporized compromises the accuracy of the experiment, leading to an overestimated M_r due to fewer moles of gas being accounted for in the calculation.

(2)

(c)

$$\text{Total uncertainty} = 2 \times 0.001 \text{ g} = 0.002 \text{ g}$$

$$\text{Percentage uncertainty} = (0.002 \text{ g} / 0.460 \text{ g}) \times 100\%$$

$$= 0.435\%$$

(1)

8. c

(1)

9.

Given:

- Yield of methylpropanal = 552 mg = 0.552 g
- Organic starting material used = 1.00 g
- Molar mass of methylpropanal ($\text{C}_4 \text{H}_8 \text{O}$) = 72 g/mol

Moles of reactant:

$$\text{Moles of reactant} = 1.00 / 116 = 0.00862 \text{ mol}$$

Calculate moles of product (methylpropanal):

$$\text{Moles of methylpropanal} = 0.552 \text{ g} / 72 \text{ g/mol} = 0.00767 \text{ mol}$$

$$\text{Theoretical yield} = 0.00862 \text{ mol} \times 72 \text{ g/mol} = 0.62064 \text{ g}$$

$$\text{Percentage yield} = (0.552 \text{ g} / 0.62064 \text{ g}) \times 100\% = 88.9\%$$

Calculate the percentage atom economy:

$$\text{Percentage atom economy} = (72 \text{ g/mol} / 108 \text{ g/mol}) \times 100\% = 66.7\%$$

Percentage Yield:

Ensures efficient conversion of reactants into products, maximizing product output.

Percentage Atom Economy:

Ensures most of the reactant mass ends up in the desired product, minimizing waste and by-products.
