Antibodies and vaccination

Question Paper 7

Level	International A Level
Subject	Biology
Exam Board	CIE
Topic	Immunity
Sub Topic	Antibodies and vaccination
Booklet	Theory
Paper Type	Question Paper 7

Time Allowed: 63 minutes

Score : /52

Percentage : /100

Grade Boundaries:

A*	Α	В	С	D	Е	U
>85%	'77.5%	70%	62.5%	57.5%	45%	<45%

1 (a) Complete the table to **describe** three differences between DNA replication and DNA transcription.

DNA replication	DNA transcription
	T

		[3]
(b)	Errors during replication may lead to gene mutations.	
	Define the term gene mutation.	
	CHEMISTAL CINETINE	
		. [2]

(c)	anti	ne disease-causing organisms undergo frequent mutation, changing their surface gens and making the disease much more difficult to control with a vaccination gramme.
	(i)	Explain why existing vaccines may no longer be effective when the surface antigens of a disease-causing organism change.
		[2]
	(ii)	State precisely the type of immunity gained by a person who has been vaccinated.
		[1]
(d)		virus causing measles is said to be antigenically stable as it rarely mutates. Measles cination programmes have been successful in preventing epidemics in many areas.
		line two reasons why measles is still common in many parts of the world, even ugh the vaccine is available.
		[2]
		[Total: 10]

2	Mala	aria and tuberculosis (TB) are two of the most important infectious diseases.
	(a)	Define the term infectious disease.
		[1]
	(b)	Describe how malaria is passed from an infected person to an uninfected person.
		[2]

Fig. 4.1 shows the worldwide distribution of malaria.

Fig. 4.1

(c)	Unlike malaria, TB is found across the whole world.
	Explain why malaria shows the distribution pattern shown in Fig. 4.1, but TB is found everywhere.
(al\	Vasinations are used to control infantious dispasses. They were used as part of the
(d)	Vaccinations are used to control infectious diseases. They were used as part of the programme to eradicate smallpox and as part of the continuing programmes against diseases such as polio and measles.
	Smallpox was eradicated from the world in the 1970s. Polio is likely to be the next infectious disease to be eradicated. TB and malaria continue to be important diseases.
	Explain how vaccination provides immunity as an important part of programmes to control and eradicate infectious diseases.
	CHEMISTRYONLINE
	re1
	[5]
	[10(a), 12]

3 (a) Complete the table by indicating with a tick (✔) or a cross (✗) whether the statements apply to proteins, DNA, messenger RNA and cellulose.

You should put a tick or a cross in each box of the table.

statement	protein	DNA	messenger RNA	cellulose
hydrogen bonds stabilise the molecule				
glucose is the subunit molecule				
subunits are joined by peptide bonds				
may be hydrolysed to amino acids				
contains uracil				

[5]

During an immune response, B-lymphocytes become plasma cells and begin to make polypeptides that are assembled into antibodies.

Fig. 3.1 is a diagram showing the formation of a polypeptide at a ribosome in a plasma cell.

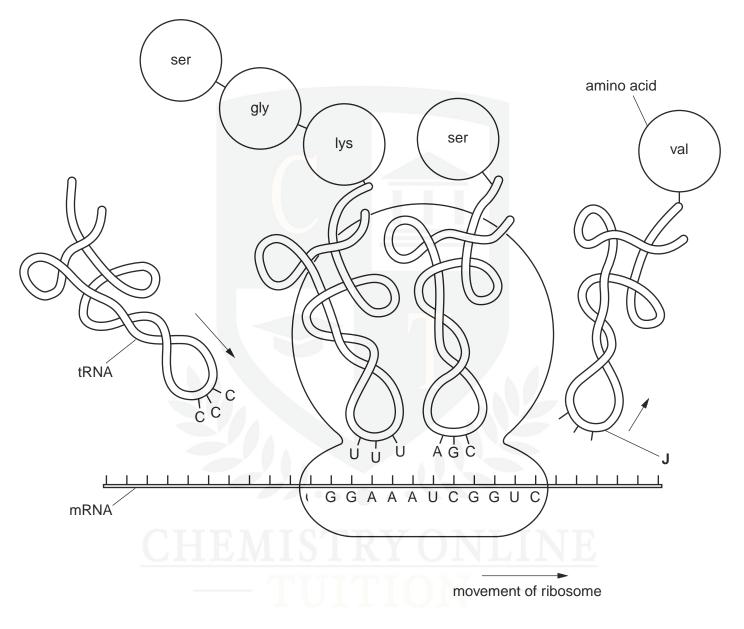

Fig. 3.1

(b) State the sequence of bases at J.[1]

(c)	Use the information in Fig. 3.1 to describe the role of transfer RNA molecules in translation.
	[5]
Duri	bacterium that causes cholera, <i>Vibrio cholerae</i> , releases a toxin known as choleragen. ing an immune response to cholera some B-lymphocytes produce antibodies that combine choleragen so inactivating it. Antibodies that inactivate toxins are called antitoxins.
(d)	Explain how the structure of an antibody, such as the antitoxin for choleragen, makes it specific to one substance.
	CHEMISTRY ONLINE
	—— TIIITION ——
(2)	Explain why shalars remains a significant infectious diseases in some parts of the world
(e)	Explain why cholera remains a significant infectious disease in some parts of the world.
	[3]

4 Bone marrow contains stem cells that divide by mitosis to form blood cells. Each time a stem cell divides it forms a replacement stem cell and a cell that develops into a blood cell.

Fig. 3.1 shows changes in the mass of DNA in a human stem cell from the bone marrow during three cell cycles.

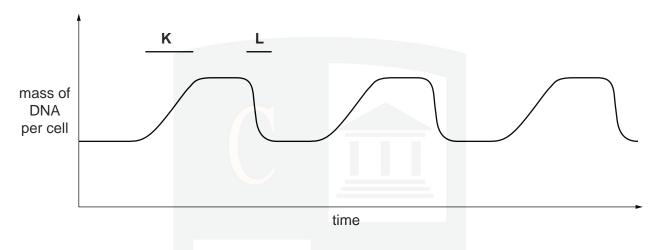

Fig. 3.1

(a) With reference to Fig. 3.1, state:

(i)	what happens to bring about the changes in the mass of DNA per cell at K and	d at L
	К	
	L	
		[2]
(ii)	how many blood cells are formed from the stem cell in the time shown	
		[1]
(iii)	what happens to the number of chromosomes in the stem cell.	LA.
		[1

	m cells in bone marrow give rise to phagocytes, B-lymphocytes and T-lymphocytes.
(b)	Describe how a red blood cell develops from a stem cell.
	[3
(c)	During an immune response, cells divide by mitosis.
	Describe how mitosis is involved in an immune response.
	[3
d)	Describe the modes of action of T-lymphocytes during an immune response.
